Chapter 1: Algebraic Expressions

An algebraic expression is a mathematical phrase that can contain ordinary numbers, variables (like x or y), and operators (like add, subtract, multiply, and divide).

We use variables because some numbers change or are unknown.

If a pizza costs 200, the cost for 'n' friends is 200 * n, which we write as 200n.

Variable: A letter used to represent an unknown number.

Coefficient: A number multiplied by a variable.

Term: Parts of an expression separated by + or - signs.
